SUMMARY

Platform and identity engineer with 6+ years building infrastructure, 5+ at Microsoft across the Microsoft Graph ecosystem, plus founding-CTO experience at two startups. Lead engineer for Microsoft Graph Bicep: took it to public preview, tripled supported resource types, and grew usage 40%. Drove cross-team identity security work spanning MSAL, Azure Identity, Entra, and M365. Founding CTO of Open Health Initiative, healthcare payments and data infrastructure in Nigeria, and co-founder/CTO of Mingla, a two-sided experience marketplace live on iOS and Android.

SKILLS

Languages: C#, TypeScript, JavaScript, Python, PowerShell, Bicep, KQL, SQL, Shell/Bash
Cloud & Platforms: Azure, Azure Resource Manager, AWS, GCP, Docker, CI/CD, React Native (Expo), Next.js, Supabase, Stripe Connect
Domains: Distributed systems & API design, identity & authentication, infrastructure as code, reliability & observability, threat modeling & secure development, payments and health-data interoperability (FHIR/HL7), AI-assisted engineering

EXPERIENCE

Microsoft Corporation June 2021 – Present
Software Engineer II 2024 – Present
Software Engineer 2021 – 2024

Platform Architecture & Infrastructure

- Lead engineer and subject-matter expert for Microsoft Graph Bicep (Microsoft Graph's Azure Resource Manager integration), Microsoft's infrastructure-as-code platform for Graph resources. Took it to public preview in September 2025, about a month after taking it on, then tripled supported resource types and grew usage 40% with full API compatibility; guide a team of two engineers.
- Set the platform's technical direction, delivering typed relationship modeling, singleton and stream properties, polymorphic resources, automatic type injection, and Agent Identity Blueprint support.
- Replaced code-change-per-resource onboarding with a configuration-driven model and end-to-end CI/CD, cutting partner onboarding from 3 weeks to 1 week and onboarding 6+ partner teams; added Copilot coding agents that automate schema generation, code, docs, validation, and pull requests.
- Separated Graph Bicep into an independent, self-hosted platform with its own repository, pipelines, and publishing workflows, speeding builds and releases and removing cross-team blockers; led its threat modeling and security-architecture review.

Reliability & Observability

- Led a redesign of GraphLogs, the company-wide internal tool Microsoft engineers use to debug Graph requests: incident-system deep links, HTTP/TLS diagnostics, throttling fixes, and sovereign-cloud support. Cut query latency and results load time by about 20%, and added routing that sends results to the owning team and separates customer-reported incidents (CRIs) from other requests. Reduced escalations, time to diagnose, and on-call load, then handed it off in a stable state.
- Recurring on-call engineer for Microsoft Graph and directly responsible individual (DRI) for Graph Bicep; resolved production incidents across deployments, request routing, claims processing, and telemetry.
- Built observability for self-hosted Graph services on Microsoft's internal monitoring platform, plus Synapse-based usage and lifecycle analytics that gave Graph extensibility teams data-driven visibility into adoption and health.

Identity & Security

- Drove Access Token Proof-of-Possession and Web Account Manager (WAM) integration for the Microsoft Graph PowerShell SDK, whose authentication module has 220M+ downloads, aligning MSAL, Azure Identity, Entra, and M365 teams to close a token-replay attack vector for every SDK user.
- Led migration of the AzureAD, AzureADPreview, and MSOnline PowerShell modules from ADAL to MSAL, moving every customer off ADAL before its full retirement with zero escalations since; built compatibility tooling that kept customers' legacy scripts running through the transition.

Open Health Initiative (OHI) ohealth-ng.com
Chief Technology Officer (founding team) March 2026 – Present

- Own architecture, engineering, security, and compliance for a healthcare payments and data infrastructure company serving Nigerian hospitals, HMOs, and government agencies.
- Designed a payments model in which card, bank transfer, WhatsApp, POS, installment, and HMO payments all reconcile into one healthcare record with a single audit trail, including offline POS reconciliation for clinics with intermittent connectivity.

- Built FHIR/HL7-based data interoperability and operational analytics; the platform is live at 6 public healthcare facilities, with 33 signed and an HMO partnership.
- Set the multi-year technical roadmap across identity, logistics, clinical AI, and a healthcare compute platform.

Mingla usemingla.com
Co-founder & Chief Technology Officer September 2025 – Present
- Co-founded and lead all engineering for a two-sided experience marketplace: the Mingla consumer app and the Mingla Host app for venues and organizers, both live on the App Store and Google Play since the spring 2026 launch, with users in Nigeria, Europe, and the US. Own apps, backend, infrastructure, CI, migrations, deploys, and sprint planning.
- Architected a monorepo spanning two React Native (Expo) apps, a React admin dashboard, a Next.js marketing site, and a Supabase backend; built organizer commerce with Stripe Connect payments, orders, QR check-in, and guest lists.
- Built the growth and marketing stack: ad attribution across Meta, TikTok, Reddit, and Snap through browser pixels plus fail-open server-side conversion APIs, AppsFlyer smart links for install attribution, a search-indexing lifecycle for the marketing site, transactional email, and outbound calling.
- Built business-operations tooling, including an admin dashboard for moderation, analytics, and support, and a venue-prospecting pipeline seeded from production data to drive supply acquisition across launch cities.
- Set engineering governance for a team working alongside AI coding agents: a 14-rule architecture constitution, architecture decision records, CI-gated tests, and guards that block destructive agent commands.

Data Engineering and Predictive Analytics Laboratory
DevOps Engineer May 2020 – May 2021
- Cut data-segmentation processing time 50% with a Python pipeline preparing API-sourced data for machine-learning models.

PUBLICATIONS

Automated Detection and Quantification of Transverse Cracks on Woven Composites
Morgan State University · Johns Hopkins University · U.S. Army DEVCOM Army Research Laboratory
- Co-authored research on experimental evaluation of armor materials and presented findings to Army stakeholders.

EDUCATION

Morgan State University
Master of Science (M.Sc.), Advanced Computing
Master of Engineering (M.Eng.), Electrical & Computer Engineering
Bachelor of Science (B.Sc.), Electrical & Computer Engineering
